

Are solar panels harmful?

Solar panels contain materials like silicon and aluminum, but are safely encapsulated, reducing potential exposure to harmful substances. Research shows no link between solar panels and cancer; the radiation emitted is non-ionizing and far below harmful levels.

Can solar panels cool a roof?

A study from the University of California, San Diego, found that solar panels can reduce the roof temperature by an average of 5 degrees Fahrenheit during the day. This cooling occurs because solar panels absorb sunlight that would otherwise hit the roof and convert it into energy, reducing the heat transferred to the building.

Do solar panels emit harmful electromagnetic fields?

One of the most common concerns is the potential for solar panels to emit harmful electromagnetic fields (EMFs) or radiation. Since solar systems generate electricity from the sunlight, panels and their associated equipment, such as inverters and wiring, produce EMFs.

Do solar panels cause cancer?

No. In a world where just about everything seems to cause cancer, solar energy adopters can rest assured that their rooftop panels will not create or add any unnecessary harm. For decades, studies have been performed to conclude that there are no associations between solar energy and cancer.
