

For the hot side of the device, they applied a specialized black metal technology developed in Guo's lab, which modified ordinary tungsten to selectively absorb light at solar ...

Typical solar panels utilize photovoltaics to produce an electric current, converting light. However, solar thermoelectric generators (STEGs) are becoming an alternative source, as they ...

In this study, a novel hybrid device was proposed with a fabric assisted photothermal layer between PV and TEG to enhance the power generation. Black TiO₂ was synthesized from TiO₂ ...

Using a "black metal technology" developed in the lab, and laser-etching nanoscale structures into these STEGs, the team increased efficiency by up to 15 times. The results of the ...

Unlock the potential of black metal for solar energy. Discover how this innovation could revolutionize power generation today!

Recent advancements in solar technology have shown that black metal, specifically black silicon, could hold the key to significantly boosting solar power generation efficiency.

For the study, scientists tested three strategies to create the new STEGs with a special black metal technology and high-tech lasers to enhance solar energy absorption.

His lab's innovative black metal technology design helps create a STEG device 15 times more efficient than previous devices, paving the way for new renewable energy technologies.

A Rochester team engineered a new type of solar thermoelectric generator that produces 15 times more power than earlier versions.

Essentially, the engineered black metal acts as a highly selective solar absorber, efficiently converting sunlight into thermal energy localized on the hot side of the STEG, thereby ...
