Can a photovoltaic system control a weak grid?

This paper delves into a damping control approach for a photovoltaic (PV) system connected to a weak grid by modifying the inverter control configuration through virtual impedance. High-frequency resonance (HFR) is examined through the modeling of PV system impedance in conjunction with a weak grid.

Can PV inverters be integrated in weak grid conditions?

In enhancing the integration of grid-connected PV inverters in weak grid conditions, phase-locked loops (PLLs) and voltage-current controllers are employed. As a result, this gives rise to various multi-temporal stability issues across a broad frequency spectrum for the functioning of large-scale power facilities .

How does a weak network affect a photovoltaic system?

The interaction of photovoltaic (PV) systems with a weak network results in resonance due to mutual impedance, leading to disturbances and the generation of harmful harmonics. The high equivalent impedance of PV systems in comparison to weak networks results in high-frequency resonance (HFR).
