

This study focused on the optimization of energy generation at Kainji hydropower station in Nigeria using operational and ecological integrity constraints.

In an ecological system, integrity means the soil can still sequester carbon, the watershed can still filter and deliver clean water, and the diverse community of organisms can still ...

This book presents design principles, performance assessment and robust optimization of different poly-generation systems using renewable energy sources and storage technologies and is a useful tool ...

This paper introduces Ecological Flow Energy Storage (EFES), a cost-effective, environmentally sound solution to enhance grid flexibility. EFES involves building small reservoirs downstream of existing ...

EFES involves building small reservoirs downstream of existing hydropower plants to temporarily store ecological flows. This decouples ecological requirements from electricity generation, enabling ...

Managed Services A full lifecycle of services covering the design, procurement, commissioning, operation, and optimization of energy storage and hybrid systems, helping asset owners maximize ...

In conclusion, the safety and environmental impacts of battery storage systems in renewable energy present complex challenges that require coordinated action from policymakers, industry ...

A green hybrid concept based on a combination of liquid air energy storage with concentrated solar power technology is evaluated through simulations to quantify the ...

Develop guidance on sizing of energy storage systems, both batteries and hybrid energy storage systems, to provide a given set of services based on hydropower generation and utilization of the ...

This project was intended to provide a high-level comparison of environmental, health and safety impacts associated with building, operating and decommissioning different types of utility-scale ...
