

Do electric cars produce more mpg than gas cars?

The average EV sold in the U.S. produces the equivalent emissions of a theoretical gas car that gets 91 mpg. In fact, in all U.S. locations, the average electric car produces less emissions than the average gas car. It may seem surprising that electric cars produce any emissions at all, since they have no tailpipe emissions.

Is charging an electric car cheaper than fueling a gas car?

Charging an electric car is typically cheaper than fueling a gas car, especially when considering fluctuating gasoline prices. Over time, the cumulative savings from lower maintenance and fuel costs can make electric vehicles a more economical choice, despite their higher initial cost.

What is the difference between gas and electric cars?

Unlike gas cars that have multispeed transmissions, electric cars have a single-speed transmission that sends the power from the motor to the wheels, which causes them to turn. This means there's only one gear in an electric car in addition to reverse and park. On the flip side, gas cars use an internal combustion engine to make the car move.

How much does an EV cost compared to a gas car?

For a \$40,000 EV versus \$30,000 gas car, fuel and maintenance recover the difference by year three at 12,000 miles annually. Battery costs drop and used EV supply increases, enhancing affordability in 2025. Location-specific calculators confirm that most owners recoup costs swiftly.
