

In this context, this article proposes a novel suppression strategy based on third harmonic current injection for the delta-connected high-voltage BESS.

These fluctuations may arise due to increased power demand, pulsed loads, or significant variations in renewable energy output, particularly on cloudy days.

The present work proposes a detailed ageing and energy analysis based on a data-driven empirical approach of a real utility-scale grid-connected lithium-ion battery energy storage system...

Experimental studies indicate that, during storage time, applying a certain strategy of bidirectional pulse current (BPC) can provide additional ampere-hour throughput for V2G interaction. More excitingly, this ...

Therefore, this article proposes an N+1 level dynamic chopping structure energy storage system topology to compensate and stabilize the DC bus voltage. Meanwhile, in order to improve DC bus voltage compensation ...

This paper advances the development of next-generation energy storage systems based on smart batteries. The investigated approach integrates a half-bridge converter into each battery, enabling pulsed ...

This article presents an investigation of the effect of different current patterns (constant- and pulsed-current discharge) on battery performance. Constant current (CC) and pulsed current (PC) cycles ...

This review provides a comprehensive analysis of the effect of pulse charging on battery cycle stability and discusses optimized strategies for charging management, thermal regulation, and the ...

As the most popular energy storage devices used in consumer electronics and EVs, the LIBs operated under pulsed current are one of the most competitive technologies to provide flexibility for future ...
