

Photovoltaic panel junction box strength test

How does a PV junction box pass a Type Approval test?

The PV junction box passes the test if there is no flaming of the junction box, and no flaming or charring of the cheesecloth in contact with the junction box. An important part of the procedure for type approval certification is ensuring the quality and compliance of the PV components.

How to test a PV junction box?

To check if the PV junction box is suitable to be mounted or operated at lower temperatures, a cold impact test has to be performed. After storing the PV junction box for a minimum of 5 hours in a test chamber having a temperature of $-40\pm 176^{\circ}\text{C}$, four impacts, each having an energy of 1J, will be administered to the box in different positions.

Can a PV junction box be used with multiple rated currents?

If the PV junction box is intended to be used with several types and/or combinations of bypass diode and/or with several rated currents of the PV junction box, the tests must be performed in all possible combinations with the relevant number of specimens. Another consideration is whether or not the PV junction box is potted.

Can a PV junction box be tested according to a standard EN 50548?

Of course, box can be performed according to if a PV junction box is to be tested in European standard EN 50548 and to combination with a PV module, the tests national documents such as DIN V can be performed on the complete sample. VDE V 0126-5 or UL-subject 3703.
