

Scientists at the University of New South Wales (UNSW) Sydney are pioneering a "reverse solar panel" technology that flips traditional photovoltaics on its head, generating small ...

Reverse power flow occurs when the power generated by a grid-connected solar PV system exceeds the on-site consumption and flows back into the utility grid.

Scientists are ironing out the kinks for an "anti-solar power" cell, one that can harvest energy at nighttime, even when the sun isn't shining. Instead of absorbing light from the Sun and ...

In a new study, experts developed a new model that could do the functions of conventional solar panels in reverse. According to the authors, these devices could produce power ...

Australian scientists are developing a "reverse solar" panel--a thermoradiative diode that converts the Earth's emitted infrared heat into electricity at night, with potential future...

It produces only a little power, but its innovative approach could support hardware that operates during lengthy periods of total darkness, such as deep-space satellites.

In a world first, a team at the University of New South Wales has demonstrated measurable power generation from "the inverse of a conventional solar cell."

Imagine solar panels that keep producing power long after the sun disappears. Australian researchers have developed a "reverse" technology that harnesses Earth's own heat loss to ...

To fill this gap, scientists are exploring solar-cell-like devices that could generate electricity by exploiting the conditions at night. Thermoradiative diodes are like solar cells in...

For obvious reasons, today's sun-powered solar cells don't work at night. But researchers from the University of California, Davis believe that they may have come up with a solution. And it's ...
