

Do monopoly utilities have monopsony power?

This latter condition applies particularly to wind and solar power facilities. As a single exclusive buyer in a restrictive geographic market for new electricity resources, monopoly utilities thus have what is called monopsony power. Compared to studies of monopolies, economists have given less attention to monopsony buyers of primary resources.

Does energy trade access affect monopoly power?

Tariff shocks induced variations in market power are more likely to result from price drops in the product market. This study validates the presence of the classical Ricardian effect and the Schumpeterian effect. We theoretically and empirically investigate the effect of energy trade access on the monopoly power of China's power sector.

Are vertically integrated utilities monopolies?

Higher seller's market share - Vertically integrated utilities are by definition monopolies, with captive customers, although they may compete for large, relatively mobile customers. Higher buyer's market share - If there is only one monopoly utility in the region, then it will have a high share of the local market for power generation.

Does monopoly affect market power?

Lu and Yu (2015) also demonstrate this pattern using Chinese data. Specifically, this is because when the market is already competitive, the impact of trade is smaller than when the level of monopoly is high. In other words, when the degree of monopoly is high, there is more scope for market power reductions resulting from pro-competitive effects.

This figure illustrates three prototypical power market firms. Independent power producers develop and operate generation resources, and typically lack market power. Wires-only utilities ...

The flawed regulatory process that has enabled the decades-long trend of consolidation in the energy industry, and why it is at odds with the current trend toward decentralized, local, customer ...

In fact, China today holds a virtual monopoly in the PV sector. Indeed, the People's Republic has gone from 7% of world solar panel production in 2005 to 70% in 2022. How did China ...

We theoretically and empirically investigate the effect of energy trade access on the monopoly power of China's power sector. We construct plant-level import and export tariff shocks, ...

China's industry ministry has warned companies making photovoltaics (PV) - panels for solar power - that serious problems in the sector show an "urgent need to deepen industry ...

With a lead on investment and innovation in the solar sector, China has solely handled the reduced costs that have made solar photovoltaic the most affordable power generation technology in ...

This is an extract from a recent report "Progress in Diversifying the Global Solar PV Supply Chain" by The Renewable Energy Institute. Key Factors and Issues behind China's ...

Energy generation from renewables continued its steady upward trend, as a result of increases in solar generation (and despite a drop in wind and hydro generation).

The notion that renewable energy is a level playing field, where companies can compete on price and efficiency, is a myth. The reality is that governments around the world are heavily ...

Distributed energy, solar, and battery storage are making electricity demand more elastic. As consumers self-generate and defect from the grid, traditional cost-of-service regulation ...
