

While solar energy installations are exploding worldwide, driven by plummeting costs and aggressive policy support, the United States finds itself curiously on the sidelines.

In this article, we will explore the current state of clean energy adoption in the United States, highlighting areas where the country leads and areas where it lags behind. In recent years, ...

The EIA report highlighted wind and solar power as the biggest areas of growth in recent years.

A UCS analysis showed that wind, solar and other renewables would nearly triple to 60 percent of US electricity generation in 2030 and 92 percent in 2050, while gas use would fall from ...

Even in Wisconsin, solar energy is booming. But the state lags behind other parts of the US. Solar energy is now the cheapest way to produce electricity and poised to become the world's ...

As the U.S. continues to grapple with the challenges of Plug-In Solar adoption, there is growing recognition that the current regulatory framework may not be adequate to accommodate this ...

As countries worldwide increasingly adopt renewable energy sources, the United States lags, primarily due to its preference for gas over cleaner alternatives.

Solar capacity is forecast to grow 9% in 2025, while wind is expected to jump 21%. And China is way ahead of everyone - it's expected to install 66% of the world's new solar and 69% of ...

U.S. energy legislation has spurred investment in and development of solar technology, while other sectors such as hydrogen and geothermal energy have not seen as much growth.

US manufacturers do not produce enough solar panels to meet the nation's demand, but industry investments and federal tax incentives have been making progress.
