

One of the most emblematic cases is the Shibuya Station in Tokyo, where since 2008, the piezoelectric panels installed at the entrances power part of the lighting system. The same happens ...

Its tiles were installed at the London 2012 Summer Olympics to power LED lights using the energy created from the footsteps of visitors to the Games. As Tokyo has such a large population--and ...

Japan has a knack for turning the ordinary into the futuristic. Case in point: in busy spots like Shibuya Crossing and Tokyo Station, the ground beneath your feet is generating electricity. Not in a ...

In Japan, these materials are embedded in floor tiles and mats in high-traffic areas, capturing the energy from millions of daily footsteps. The generated electricity can then be stored and used to power ...

Japan turns footsteps into electricity using piezoelectric tiles, a groundbreaking technology trending on X (#JapanTech) in 2025. From Shibuya Station to shopping malls, generating electricity from footsteps is ...

These innovative tiles generate small bursts of electricity with every step, helping power lights and sensors around the station.

Tokyo's Shibuya Station transforms the constant motion of millions of commuters into clean electricity through innovative piezoelectric floor tiles. This remarkable technology captures the ...

Japan is harnessing renewable energy through piezoelectric technology, converting footfalls into electricity. Piezoelectric sensors are integrated into floors, utilizing mechanical stress ...

By incorporating this next-generation power source into a major public facility, the city has seized an opportunity to raise environmental consciousness among its residents.

Japan's urban transit hubs are redefining renewable energy generation in the most human way possible, through footsteps. Piezoelectric floors installed at Tokyo and Shibuya Stations convert ...
