

What are the components of a battery pack?

Cells: The actual batteries. These can be any type, such as lithium-ion, nickel-metal hydride, or lead-acid.

Battery Management System (BMS): This is the brain of the battery pack. It monitors the state of the batteries to optimize performance and ensure safety.

Connectors: To link the batteries together.

How does a battery pack work?
Connectors: To link the batteries together. They maintain the electrical flow and balance the load across all cells. **Housing/Casing:** This protects the internal components from physical damage and environmental factors. Battery packs work by connecting multiple individual cells in series or parallel to increase voltage or capacity.

What is a battery pack?

A battery pack is a set of any number of (preferably) identical batteries or individual battery cells. They may be configured in a series, parallel or a mixture of both to deliver the desired voltage and current. The term battery pack is often used in reference to cordless tools, radio-controlled hobby toys, and battery electric vehicles.
