

# What is not lacking in solar power generation

Why is there an undersupply of solar energy?

The problem is twofold. During peak energy demand periods, there can often be an undersupply of solar energy due to a low or non-existent solar energy supply, requiring alternative, mainly non-renewable, energy sources to be utilized to meet the demand.

What are the challenges of relying on solar energy?

A fundamental challenge of relying on solar energy is its intermittent nature. Solar power generation is entirely dependent on sunlight, which means that solar panels can only produce electricity during the day and are subject to fluctuations in weather conditions.

What causes a mismatch in solar energy production?

This refers to the fact that solar energy production varies due to external factors, such as the time of day, season, or weather conditions. This variability often leads to a mismatch in the demand and supply of solar energy. The problem is twofold.

Should solar energy be curtailed?

While solar energy is almost always accepted into the grid due to its zero marginal generation cost, there are situations in which there is an excess of solar energy produced. When this occurs, solar PV output actually needs to be curtailed -- prevented from entering the grid -- in order to maintain the balance between supply and demand.
